

Description:

A smooth, lightweight gadget shaped a bit like a rounded, thick handle. It's designed to fit comfortably in your hand, with a hollow space inside where your fingers naturally wrap around it.

Here's what it does:

- Measuring Made Easy:
 - On one side, there's a retractable measuring tape! You can pull it out to measure things in both inches (in) and centimeters (cm).
 - On the top, there's a flat, sturdy surface with centimeter markings printed right on it, perfect for measuring small objects.
- See and Record:
 - Right on the front, there's a tiny video camera! It has a simple on/off button, so you can easily record what you're looking at.
 - Next to the camera, there's a small flashlight with its own on/off button, perfect for lighting up dark spaces.
- Storage and Power:
 - There are two small compartments with little doors for storing things like extra screws, small nails, or anything else tiny you might need.
 - It's powered by a single battery, which you can easily pop in and out.(Compartment is the one near the RAM/Storage and closed)
 - The video recordings are saved onto a small memory chip, that you can take out and put into a computer to view the videos.
- Easy to Hold:
 - The whole thing is designed to be super light and easy to hold with one hand. The hollow space inside makes it comfortable to grip.

Volume Calculations:

- Rough Exterior mold Calculations(Rectangle):

$$16/10 \times 90/10 \times 30/10 = 43.2 \text{ cm}^3$$

- Rough All Hollowed out sections of tool(Rectangles):

$$3(\text{equal sized holes: 2 for storage and 1 for battery}) = 3 \times (15/10 \times 20/10 \times 10/10) = 9 \text{ cm}^3$$

$$\text{Grip hole Volume} = 65/10 \times 12/10 \times 12/10 = 9.36 \text{ cm}^3$$

- Final Volume: $43.2 - 9.36 - 9 = 24.84 \text{ cm}^3$

Space Vs. Earth Tools:

In space, tools are designed to maximize efficiency by minimizing weight and volume, which is crucial due to strict payload constraints and the challenges of microgravity environments. On Earth, while efficiency remains important, designs can afford more weight and bulk, allowing for more specialized and comfort-oriented tools without the same severe limitations.
